

Scaling CX: Digital Coaching for Customer Service Agents

CSC207 — Software Design · Focus in Technology
Leadership

Monti Ghai · Marco Marchesano

Genesys

WHAT IS CX (CUSTOMER EXPERIENCE)?

Think of the worst experience you've had with a company. And the best.

“The connection between CX and business success is undeniable: 82% of consumers surveyed globally believe a company is only as good as its service. And 30% of consumers surveyed have stopped doing business with a company in the past year due to poor service.”

Greg Thomas— Senior Director of Thought Leadership, Genesys, Feb 2025

Who we are

Agenda

01 Who we are

02 Genesys and the Genesys Cloud platform

03 How a contact centre works

04 The project

05 The data

06 Conversation examples

connecting customer intent to the people, systems and
workflows that resolve, automate and deliver customer
experiences.

Genesys® a leader in AI-powered customer experience orchestration

Using the power of our cloud, voice, digital, data-processing and AI technologies

7,500+

organizations

500+

apps and integrations

Leader 2025

Gartner® Magic Quadrant,
CCaaS

50M+

conversations hosted daily

100+

countries with customers

6,000+

employees worldwide

Customer experience (CX) at scale

Leading the way with exceptional customer and employee experiences

over a trillion

words transcribed in the past year

**2.9 billion in
annual recurring
revenue**

600+

new features in the last year

2M+

users on Genesys Cloud

20+

AWS regions

**25,000 MCP-
compatible tools
through Pinkfish**

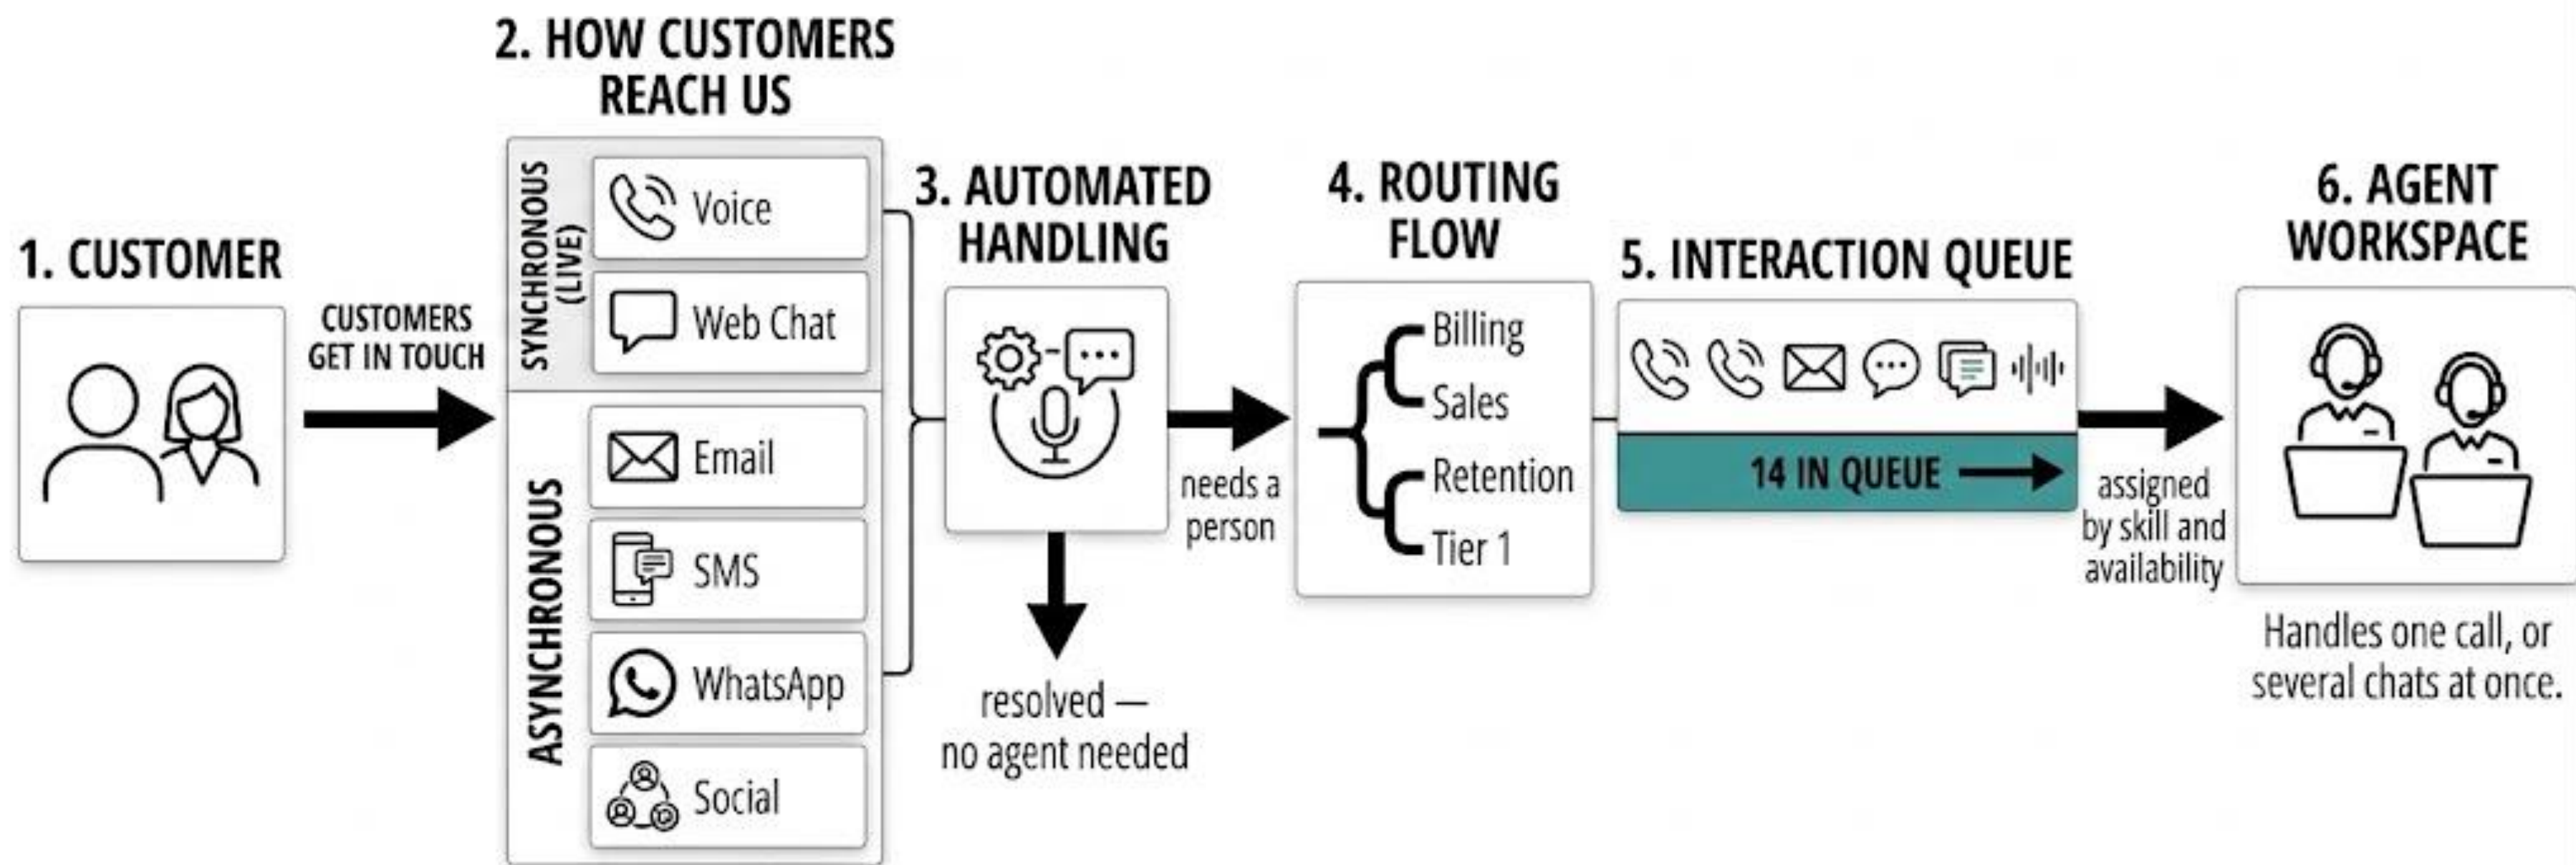

Deliver **EMPATHY** in every experience

TRUSTED BY THE WORLD'S BEST ORGANIZATIONS

Contact Centre / Genesys Cloud

At its core, a platform like Genesys Cloud connects customers to the organizations serving them through the workforce who handle their needs. It brings customers in across channels such as voice, chat, and email, routes each interaction to the right agent through queues and automated interaction flows, records and transcribes the conversations, analyzes what happened, and turns that information into business actions.

Help agents get better, so every customer gets better service

Transform everyday customer interactions and metrics into actionable guidance that helps service agents improve and deliver better customer experiences.

Workforce Engagement Management

Tools that empower companies to unlock their employees' potential,
leading to a transformed customer experience.

Used by over 90% of Genesys Cloud organisations

WEM capabilities

Making it easier to manage your people and operations across channels and teams

Workforce Management

Balance employee and business needs with accurate, flexible forecasts and schedules

Quality Assurance and Compliance

Remove bias from evaluations and identify root causes across all customer interactions

Employee Performance & Development

Promote excellence with goal transparency and personalised, gamified development

Speech and Text Analytics

Analyse conversations at scale and enhance real-time contact centre operations

How to help agents improve

Evaluations	A scored review of a real interaction against defined criteria.
Coaching appointments	A scheduled one-to-one, tied to specific interactions.
Learning and training	Courses and modules assigned to an agent, with progress recorded.
Gamification	Scorecards and leaderboards that make progress visible to the agent.
Self-review	Agents can be given access to their own interactions and transcripts.

A contact centre example

Visa aims to transform its CX with Unified Experience from Genesys and ServiceNow

WHY CARDHOLDERS MAKE CONTACT

A lost card, fraud, or a dispute they need to make. In Visa’s words, high-impact moments that have to be supported.

SCALE TODAY

106M

disputes processed annually

340+

financial institutions served

WHERE THEY ARE GOING

~24 days

average to resolve a dispute today

30%+

targeted reduction goal

Why people contact their card issuer

“I’ve lost my card”

“I don’t recognise this charge”

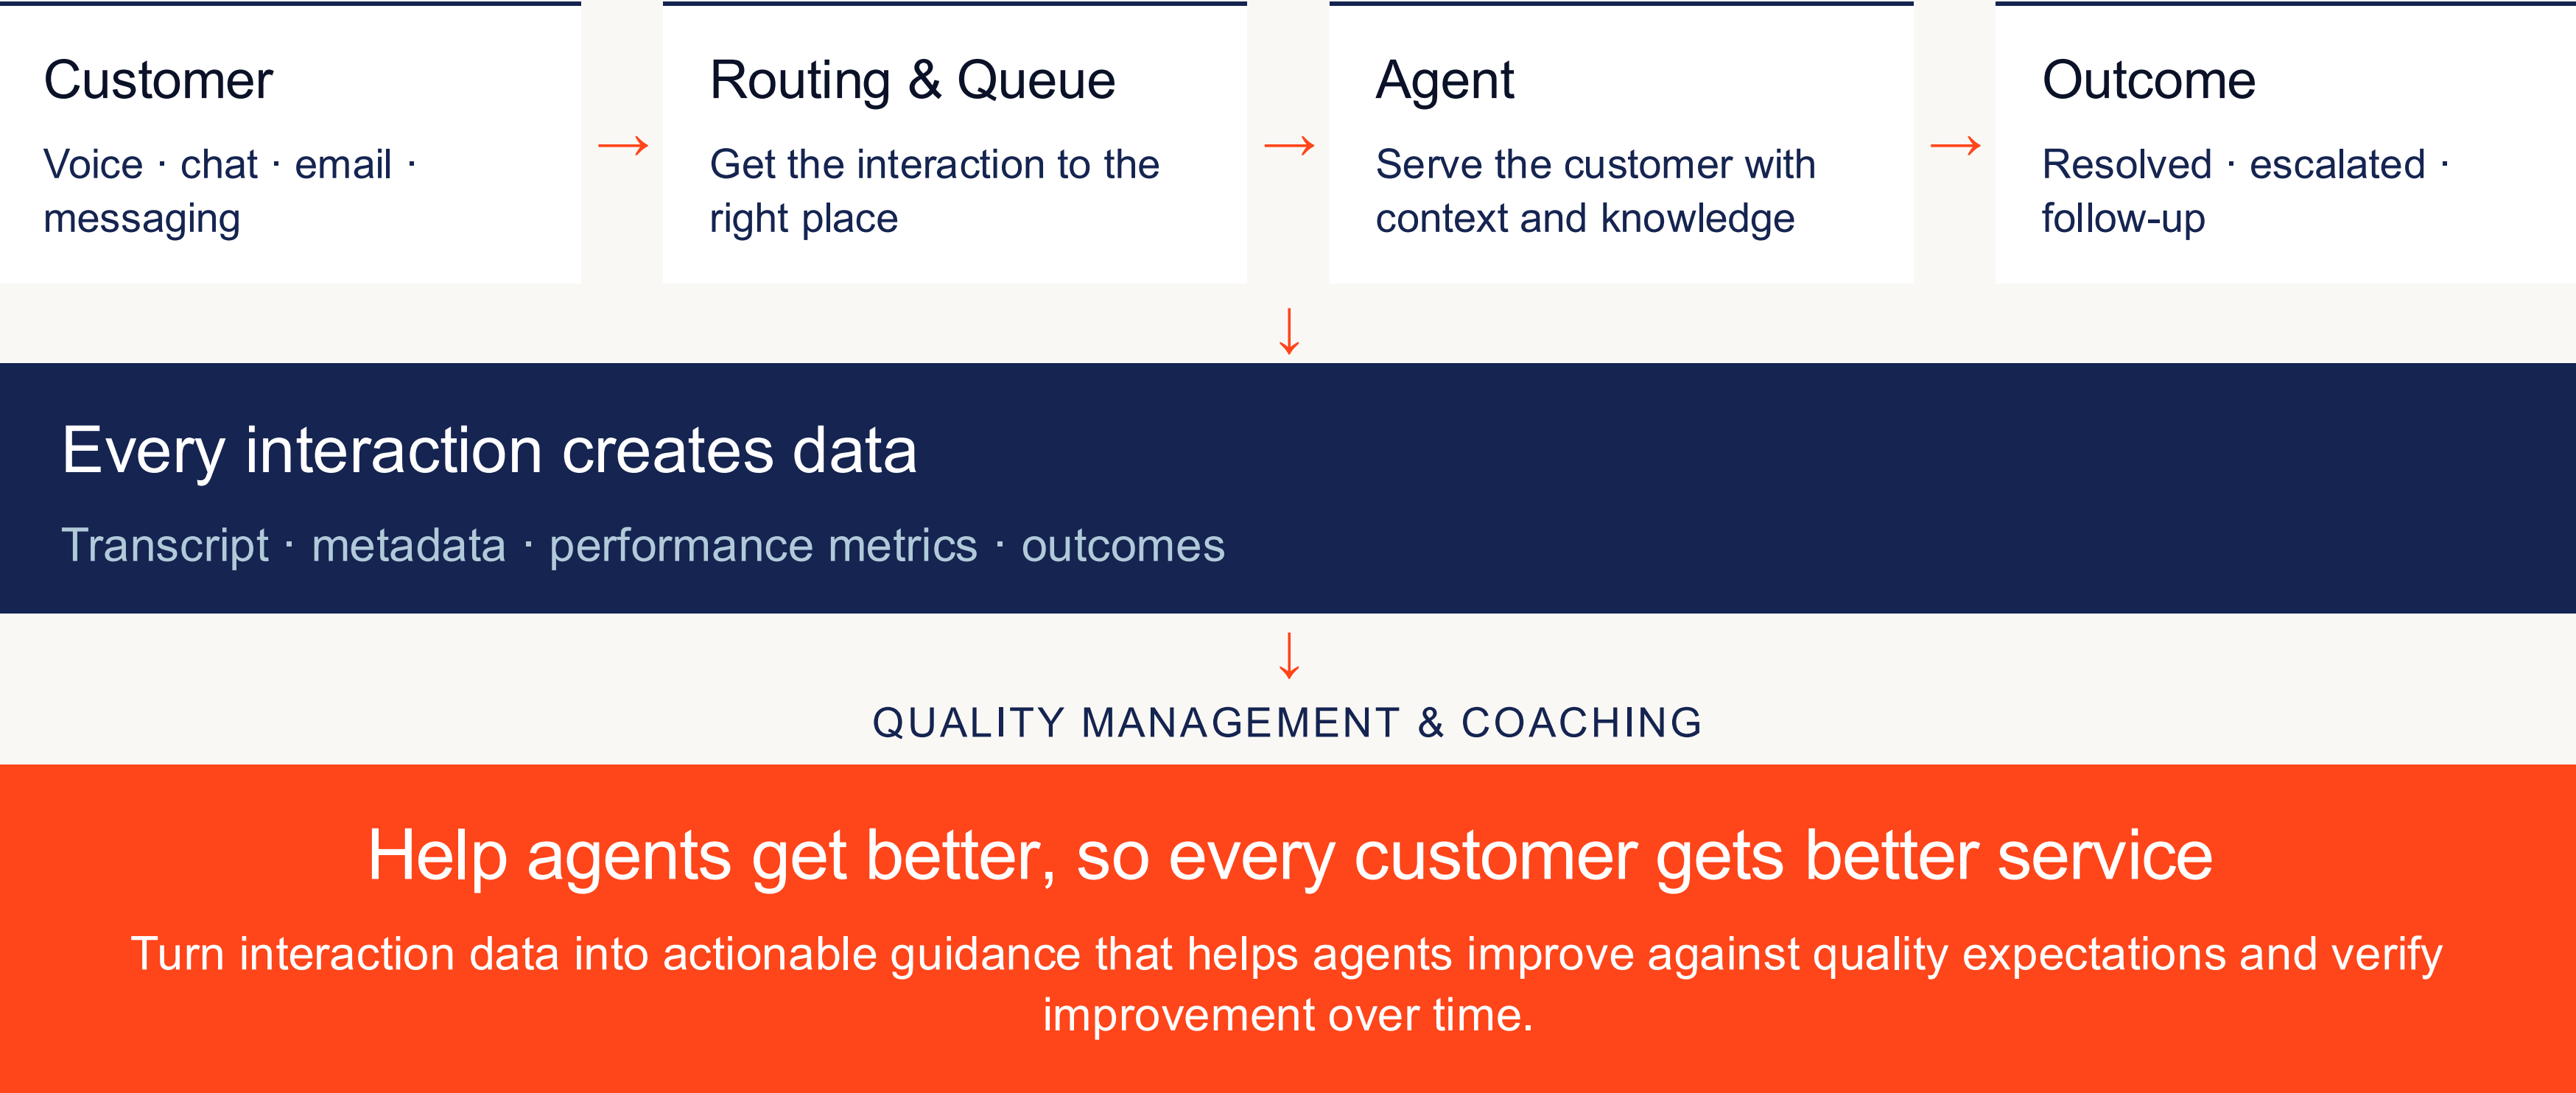

“I need to dispute a transaction”

“My card was declined”

“What’s my balance”

One interaction. Better service next time.

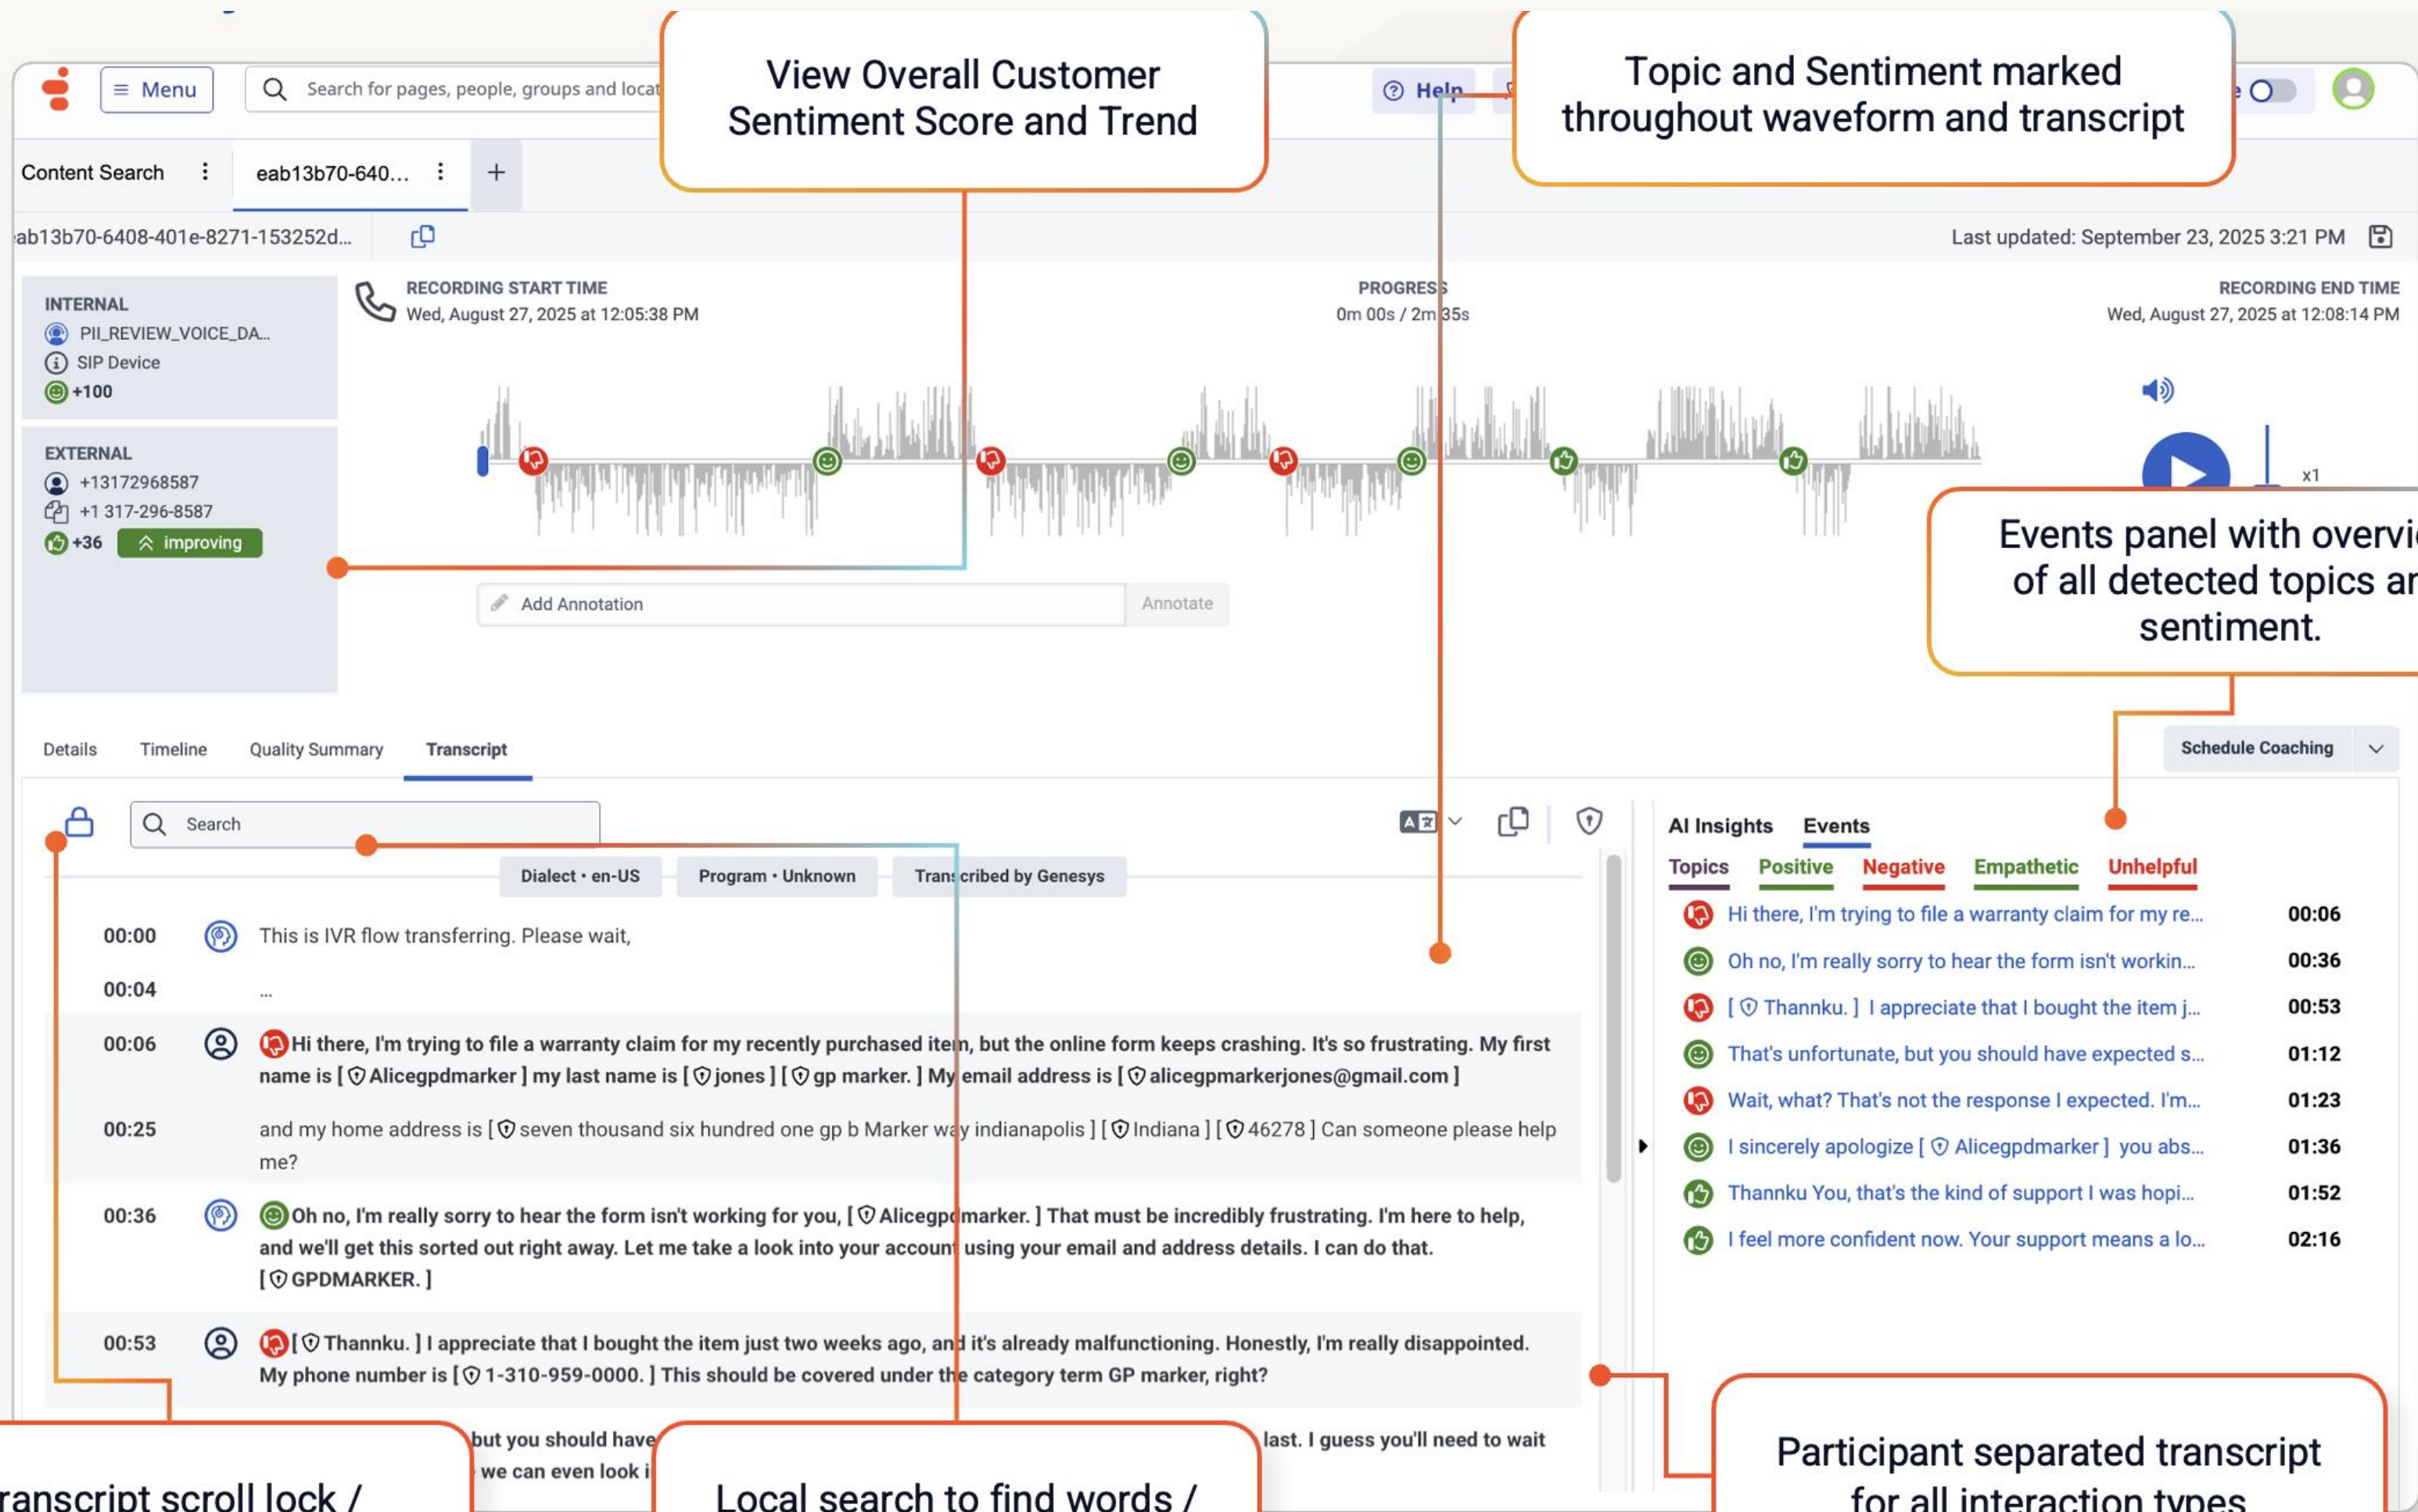

Every customer interaction creates data that can help agents improve.

The service agent’s job

QUEUE 7 waiting Longest waiting 2:14 Next arrives automatically	ACTIVE · VOICE04:32 Customerthere’s a charge on my statement i don’t recognise Agenti can see it — sixty two dollars on the fourteenth Customeri’ve never shopped there Agentokay i can raise a dispute and get the card replaced Customerhow long will that take Live transcript	CUSTOMER RECORD 3 contacts this month 1 dispute in progress Card active · no travel notice WRAP-UP Select disposition ▾ Notes

View Overall Customer Sentiment Score and Trend

Topic and Sentiment marked throughout waveform and transcript

Events panel with overview of all detected topics and sentiment.

Transcript scroll lock / unlock during playback.

Local search to find words / phrases in transcript

Participant separated transcript for all interaction types

What does performing well mean?

Compliance	Did they do the required thing	Verify identity before discussing an account · give a mandated disclosure
Process	Did they follow the documented steps	The right sequence for this type of request
Communication	Did the customer feel dealt with	Acknowledge the problem · explain clearly · no jargon
Efficiency	What did it cost	Handle time · holds · dead air · transfers
Outcome	Did it actually get fixed	Resolved · repeat contact · survey score

Using transcripts, metadata and performance metrics from contact centre and customer service interactions, create a digital coaching tool that helps an organization's customer service agents (operators) **independently improve their own performance** against configurable quality expectations, and verify that improvement over time.

Sample data available to use

1

HarperValleyBank

Call transcripts · 1,446 calls

Bank support calls from 58 agents.

2

ABCD

Full chatbot interaction · 10,042 chats

Retail support chats.

3

AppTek

Voice · 873 calls

Support calls from 82 agents across 14 English accents and 16 industries.

4

twcs (Twitter)

Social · 2.8M messages

Public replies between customers and 108 brands. Real Twitter customer support interactions.

Clone it and you already have 200 conversations

200

in the repo, ready to read

400

after one download and one build

100 per dataset, one schema

1 `git clone`

`curated/conversations/` — 200 JSON files, one conversation each. Start with `curated/CONVERSATIONS.md`.

2 `python3 scripts/download_data.py`

Fetches the four source datasets, about 90 MB of text. Safe to re-run — anything already fetched is skipped.

3 `python3 curated/build/build_curated.py`

Creates the remaining conversations once datasets are added.

One schema, four sources

A tweet and a ten-minute phone call load with the same code. A real file, trimmed to one turn:

```
{
  "id": "HVB-0001",
  "source": {
    "dataset": "HarperValleyBank",
    "original_id": "004860blab2e4c88",
    "licence": "CC BY 4.0"
  },
  "channel": "voice",
  "agent_id": "hvb-speaker-17",
  "turns": [
    { "n": 2, "speaker": "agent",
      "text": "hello this is harper valley national bank",
      "asr_text": "hello this is happy valley national bank",
      "start_ms": 3729,
      "duration_ms": 4830,
      "dialog_acts": ["greeting"] }
  ],
  "source_fields": {
    "task_assigned": ["replace card"],
    "task_logged_by_agent": ["replace card"]
  }
}
```

Six keys on every file

id, source, channel, turns, source_fields, modifications
— on all 400, so one loader reads every dataset. And every id traces back to its source corpus.

Absent means absent

Some fields only exist when provided by the original dataset.

Make the data work for your question

Add fields or metadata your project needs. Create derived values, scores, labels, or timestamps. Keep generated data clearly separate from the original source data.

What each data source provides

Pick the dataset that can carry the question you want to answer.

	HarperValleyBank	ABCD	AppTek	twcs
Channel	voice	chat	voice	social
Agent identity	58 IDs	—	82 IDs	~35%
Customer record	thin	rich	—	—
Per-turn timing	milliseconds	—	seconds	per message
Gold + machine transcript	yes	—	—	—
Intent / task label	8 tasks	10 flows	domain only	—
Documented correct steps	—	yes	—	—
Real calendar dates	4 days only	—	—	3 months
In the repo already	yes	yes	download	download

Two constraints to plan around

01

There is no existing quality score

No answer key ships with any of the four sources

What counts as a good or bad conversation is your call

So is what gets measured, and how those measures become a score

02

Only twcs has real calendar dates

twcs spans three months of real timestamps

HarperValleyBank covers four days

AppTek and ABCD have none

For a longer timeline, add synthetic timestamps across a period you choose
